Claim 1 (original): A TM microstrip antenna mounted on a projectile comprising:

- (a) a first rectangular shaped dielectric layer;
- (b) a plurality of rectangular shaped antenna elements mounted on an upper surface of said first dielectric layer, said antenna elements being aligned with one another and fabricated from copper, said antenna elements being adapted to transmit telemetry data at a frequency of approximately 2.25 GHz;
- (c) an antenna feed network mounted on a bottom surface of said first dielectric layer, said antenna feed network having a main transmission line connected to a signal input for said TM microstrip antenna, said feed network having a plurality of branch transmission lines connected to said main transmission line and each of said antenna elements, each of said branch transmission lines including a plurality of probes, one of said

22

23

24

- probes being positioned underneath one antenna element of said

  plurality of antenna elements to capacitively couple said one

  antenna element to said feed network, resulting in a linear

  polarization and an omni-directional radiation pattern being

  generated by said antenna elements of said TM microstrip antenna;

  and
  - (d) a pair of identical filters integrally formed within said main transmission line, each of said pair of identical filters being tuned at a GPS frequency of approximately 1.575 GHz to provide for a minimum isolation of 50 dB.
  - Claim 2 (original): The TM microstrip antenna of claim 1
    further comprising a continuous gap formed around first, second,
    third and fourth sides of each of said antenna elements, said
    continuous gap for each of said antenna elements having an
    electric field generated by said antenna element confined to said
    continuous gap.
  - Claim 3 (original): The TM microstrip antenna of claim 2

    further comprising a copper plated ground mounted on a remaining

    portion of the upper surface of said first dielectric layer

    around the continuous gap for each of said antenna elements.

- 1 Claim 4 (original): The TM microstrip antenna of claim 3
  2 further comprising a second dielectric layer positioned below
  3 said first dielectric layer in alignment with said first
  4 dielectric layer, said second dielectric having a ground plane
  5 mounted on a bottom surface thereof.
  - Claim 5 (original): The TM microstrip antenna of claim 4 wherein said copper plated ground mounted on the upper surface of said first dielectric layer is connected to the ground plane mounted on the bottom surface of said second dielectric layer by a plurality of vias which pass from said copper plated ground through said first dielectric layer and said second dielectric layer to said ground plane.
  - Claim 6 (original): The TM microstrip antenna of claim 1
    wherein said pair of identical filters each comprise a 5-Section
    Band Stop Filter.
    - Claim 7 (original): The TM microstrip antenna of claim 1
      wherein each of said antenna elements includes a tuning stubs
      located on one side of said antenna element, said tuning stub for

- Appl. No. 10/817,412 Amdt. dated June 21, 2005 Reply to Office action of May 26, 2005
- '4 each of said antenna element allowing said antenna element to be
- 5 fine tuned to an operating frequency for said TM microstrip
- 6 antenna.

3

4

5

6

- Claim 8 (original): The TM microstrip antenna of claim 1

  wherein said signal input for said feed network comprises a fifty
  - 3 ohm signal input for said feed network.
  - Claim 9 (currently amended): The TM microstrip antenna of claim 4 wherein said <u>first</u> dielectric layer comprises a circuit board and said second dielectric layer comprises a ground board, said circuit board and said ground board each having an overall dimension of 5.7 inches in width and approximately 27 inches in length.
  - Claim 10 (original): A TM microstrip antenna mounted on a projectile comprising:
    - (a) a first rectangular shaped dielectric layer;
    - (b) a plurality of rectangular shaped antenna elements mounted on an upper surface of said first dielectric layer, said plurality of antenna elements being aligned with one another and fabricated from copper, said plurality of antenna elements being

- '8 adapted to transmit telemetry data at a frequency of
- 9 approximately 2.25 GHz;

.13

- (c) each of said plurality of antenna elements including a tuning stub located on one side of said antenna element, said tuning stub for each of said plurality of antenna elements allowing said plurality of antenna elements to be fine tuned to an operating frequency for said TM microstrip antenna;
  - (d) an antenna feed network mounted on a bottom surface of said first dielectric layer, said antenna feed network having a main transmission line connected to a signal input for said TM microstrip antenna, said feed network having a plurality of branch transmission lines connected to said main transmission line and each of said antenna elements, each of said branch transmission lines including a plurality of probes, one of said probes being positioned underneath one antenna element of said plurality of antenna elements to capacitively couple said one antenna element to said feed network, resulting in a linear polarization and an omni-directional radiation pattern being generated by said antenna elements of said TM microstrip antenna;
  - (e) a pair of identical filters integrally formed within said main transmission line, each of said pair of identical filters being tuned at a GPS frequency of approximately 1.575 GHz

- Appl. No. 10/817,412 Amdt. dated June 21, 2005 Reply to Office action of May 26, 2005
- to provide for a minimum isolation of 50 dB, each of said pair of filters comprising a band stop filter; and
- 32 (h) a second dielectric layer positioned below said first 33 dielectric layer in alignment with said first dielectric layer, 34 said second dielectric layer having a ground plane mounted on a 35 bottom surface thereof.
  - Claim 11 (original): The TM microstrip antenna of claim 10
    further comprising a continuous gap formed around first, second,
    third and fourth sides of each of said plurality of antenna
    elements, said continuous gap for each of said plurality of
    antenna elements having an electric field generated by said
    antenna element confined to said continuous gap.
  - Claim 12 (original): The TM microstrip antenna of claim 11
    further comprising a copper plated ground mounted on a remaining
    portion of the upper surface of said first dielectric layer
    around the continuous gap for each of said plurality of antenna
    elements.
  - Claim 13 (original): The TM microstrip antenna of claim 12
    wherein said copper plated ground mounted on the upper surface of

- 3 said first dielectric layer is connected to the ground plane
  - 4 mounted on the bottom surface of said second dielectric layer by
  - 5 a plurality of vias which pass from said copper plated ground
  - 6 through said first dielectric layer and said second dielectric
  - 7 layer to said ground plane.
- Claim 14 (original): The TM microstrip antenna of claim 10
- 2 wherein said band stop filter for each of said pair of identical
- 3 filters comprises a 5-Section Band Stop Filter.
- Claim 15 (original): The TM microstrip antenna of claim 10
- wherein said signal input for said feed network comprises a fifty
- 3 ohm signal input for said feed network.
- Claim 16 (currently amended): The TM microstrip antenna of
- 2 claim 10 wherein said first dielectric layer comprises a circuit
- 3 board and said second dielectric layer comprises a ground board,
- 4 said circuit board and said ground board each having an overall
- 5 dimension of 5.7 inches in width and approximately 27 inches in
- 6 length.
- 1 Claim 17 (original) A TM microstrip antenna mounted on a

'2 projectile comprising:

- 3 (a) a first rectangular shaped dielectric layer;
- 4 (b) eight rectangular shaped antenna elements mounted on an upper surface of said first dielectric layer, said eight antenna elements being aligned with one another and fabricated from copper, said eight antenna elements being adapted to transmit telemetry data at a frequency of approximately 2.25 GHz;
  - (c) each of said eight antenna elements including a tuning stub located on one side of said antenna element, said tuning stub for each of said eight antenna elements allowing said eight antenna elements to be fine tuned to an operating frequency for said TM microstrip antenna;
  - (d) an antenna feed network mounted on a bottom surface of said first dielectric layer, said antenna feed network having a main transmission line connected to a signal input for said TM microstrip antenna, said feed network having a plurality of branch transmission lines connected to said main transmission line and each of said eight antenna elements, each of said branch transmission lines including a plurality of probes, one of said probes being positioned underneath one antenna element of said eight antenna elements to capacitively couple said one antenna element to said feed network, resulting in a linear polarization

- and an omni-directional radiation pattern being generated by said antenna elements of said TM microstrip antenna;
- 26 (e) a pair of identical band stop filters integrally formed
  27 within said main transmission line, each of said pair of band
  28 stop filters being tuned at a GPS frequency of approximately
  29 1.575 GHz to provide for a minimum isolation of 50 dB; and
  - (h) a second dielectric layer positioned below said first dielectric layer in alignment with said first dielectric layer, said second dielectric layer having a ground plane mounted on a bottom surface thereof.
  - Claim 18 (original): The TM microstrip antenna of claim 17

    further comprising a continuous gap formed around first, second,

    third and fourth sides of each of said eight antenna elements,

    said continuous gap for each of said eight antenna elements

    having an electric field generated by said antenna element

    confined to said continuous gap.
  - Claim 19 (original): The TM microstrip antenna of claim 18

    turther comprising a copper plated ground mounted on a remaining

    portion of the upper surface of said first dielectric layer

    around the continuous gap for each of said plurality of antenna

· 5 elements.
